

Enrique Herrero carried out his graduation and Ph.D. studies in Biology at the Autonomous University of Barcelona. He did a post-doctoral stay at Leicester University in England working in bacterial cell division, and then spent ten years at Rafael Sentandreu lab in Valencia where he initiated his studies on yeast cells. At the moment he is responsible of the research group on Yeast Molecular Biology at the University of Lleida, where he focuses his interests in the response of yeast cells against oxidative stress. In particular, his group is analysing the role of glutaredoxins and related enzymes in the repair of oxidative damage and in the redox regulation of diverse metabolic processes.
